HEIDELBERG PHARMA AT A GLANCE

Differentiated ADC technologies

- In plug & play mode
- 2 years from target to IND

Strong IP including platform, payload, assets, method of use and predictive biomarker

- Several IP families
- Monopoly in the Amanitin/MoA space
- Subcutaneous administration
- Patient stratification with 17p biomarker

Clinical stage

- HDP-101: 50% ORR in Cohort 5 with no signs of ocular or renal toxicities, myelosuppression or severe liver damage including one **complete remission**; Delivering RP2D in Q2/25
- HDP-102 CTA Q4/2024 & FPI Q1/2025; HDP-103 CTA Q4/2025

Partnerships

- Huadong: China-focused
- Takeda: ATAC technology
- HealthCare Royalty: Telix Pharmaceuticals

GMP manufacturing

- Fully synthetic process for Amanitin

Corporate & finance

- Experienced leadership team; 109 employees
- Cash runway: through 2026*

*taking into account the milestone payment of \$75 million from HealthCare Royalty

ADC = antibody-drug conjugate | MoA = mode of action | ORR = overall response rate | RP2D = Recommended Phase II Dose | CTA = clinical trial application | FPI = first patient in

GROWING PIPELINE OF PROPRIETARY PROGRAMS

Machine Learning Approach for Rapid, Accurate Point-of-Care Prediction of M-Spike Values in Multiple Myeloma

Ehsan Malek, MD^{1,2,3} ; Gi-Ming Wang, MS^{3,4}; Curtis Tatsuoaka, PhD^{4,5}; Jennifer Cullen, PhD, MPH^{3,4}; Anant Madabhushi, PhD^{6,7} ; and James J. Driscoll, MD, PhD^{1,2,3}

DOI <https://doi.org/10.1200/JCO.23.00078>

ABSTRACT

PURPOSE The gold standard for monitoring response status in patients with multiple myeloma (MM) is serum and urine protein electrophoresis which quantify M-spike proteins; however, the turnaround time for results is 3–7 days which delays treatment decisions. We hypothesized that machine learning (ML) could integrate readily available clinical and laboratory data to rapidly and accurately predict patient M-spike values.

METHODS A retrospective chart review was performed using the deidentified, electronic medical records of 171 patients with MM.

RESULTS Random forest (RF) analysis identified the weighted value of each independent variable (N = 43) integrated into the ML algorithm. Pearson and Spearman coefficients indicated that the ML-predicted M-spike values correlated highly with laboratory-measured serum protein electrophoresis values. Feature selected RF modeling revealed that only two variables—the first lagged M-spike and serum total protein—accurately predicted the M-spike.

CONCLUSION Taken together, our results demonstrate the feasibility and prognostic potential of ML tools that integrate electronic data to longitudinally monitor disease burden. ML tools support the seamless, secure exchange of patient information to expedite and personalize clinical decision making and overcome geographic, financial, and social barriers that currently limit the access of underserved populations to cancer care specialists so that the benefits of medical progress are not limited to selected groups.

AI IN CLINICAL TRIALS

PHARMA DRUG DEVELOPMENT CYCLE

CLINICAL TRIALS

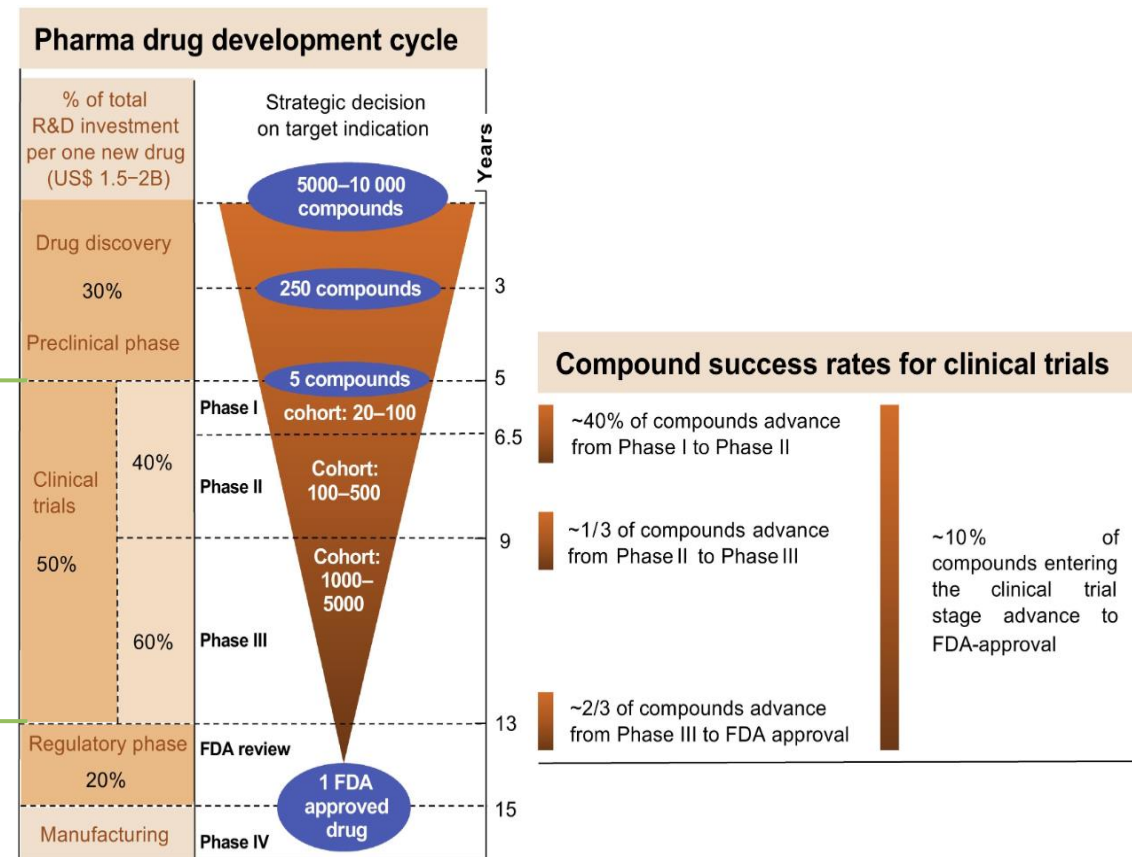

Clinical trials consume the latter half of the 10 to 15 year, 1.5–2.0 billion USD, development cycle for bringing a single new drug to market.

Hence, a failed trial sinks not only the investment into the trial itself but also the preclinical development costs, rendering the loss per failed clinical trial at 800 million to 1.4 billion USD.

Two of the main causes for high trial failure rates are:

- Suboptimal patient cohort selection and recruiting techniques
- Inability to monitor patients effectively during trials

PHARMA DDC AND COMPOUND SUCCESS RATES

Trends in Pharmacological Sciences

SURVEY ON ADOPTING AI IN PHARMA

Area of Most Significant Impact of AI in the Next 5-10 Years Distribution

Data were analysed by Chi-square goodness of fit testing, which indicated that the overall distribution was significantly different from an equal distribution ($p < 0.0001$; $n=58$). Asterisks indicate statistical significance based on standardised residuals (** $p < 0.01$, *** $p < 0.001$).

AI IN CLINICAL TRIALS

AI USE CASES AND APPLIED AI CAPABILITIES

AI Use Case	Patient recruitment	Patient monitoring	Clinical trial protocol design and authoring	Patient outcome prediction	Synthetic data generation	Improve pathology analysis
AI Capability	Pattern Recognition Classification	Pattern Recognition Classification	Prediction NLP Generation	Prediction	Generation Creativity	Image analysis Pattern Recognition Classification
Description & Outcomes	Increasing speed and probability of trial success by identifying the most suitable and eligible candidates quickly and retaining them on the trial .	Monitoring patient adherence to trial protocols and identifying deviations. Gathering additional data during trials, including observational studies, for better outcomes	Design efficient clinical trial protocols , optimizing various parameters to improve trial outcomes and reduce costs .	Developing personal treatment plans to reduce patient risk of exposure to ineffective or harmful treatments. Enhancing probability of trial success.	Enhancing trial data with synthetic data, e.g., for under-represented populations or control arm in external comparator studies.	Analysis of medical images or laboratory results.

Area:

Date:

Status:

Description of the use case

Trustworthy AI | Assessment of risks required?

- ☐ Ethical aspects (e.g. dealing with gender-specific or diverse prejudices)
- ☐ Cyber-security risks (e.g., in fully automated processes)
- ☐ Regulatory aspects (e.g. upcoming regulatory changes)
- ☐ Human-in-the-loop requirement (e.g., black swan resilience)

VALUE | Created business and/or benefit value

1. How does the use case fit in with your AI vision?

2. What strategic advantages does this offer?

3. What are the financial effects (e.g. savings, additional income)?

Score 0 to 10
Weighting 15%

FEASIBILITY | Ease of implementation

Please enter a value between 0 (strongly disagree) and 5 (strongly agree) in the boxes for the following statements. If you cannot assess a statement, please enter a minus "-".

1. Data/Infrastructure | Score:

- We have access to the required data.
- We have the required amount of data.
- We have the required data quality.

2. Algorithm/Solution | Score:

- We know of technical resources that can lead to a solution.
- A similar problem has already been solved by others.
- We know techniques that could help with this problem.

3. Processes/Systems | Score:

- No/few processes need to be changed.
- No/few systems need to be adapted.
- No/few organizational changes are necessary.

4. Know-how | Score:

- The required technology know-how is available.
- The required domain know-how is available.
- The required trainings can be executed within a reasonable time.

How long does the development of the use case take until the verified PoC (proof of concept)?

- ☐ <3 months (+5 points)
- ☐ 4–6 months (+4 points)
- ☐ 7–9 months (+3 points)
- ☐ 10–12 months (+2 points)
- ☐ >12 months (+1 point)

REQUIRED INPUT MAPS FOR AI USE CASE IDEATION

PROCESS MAP

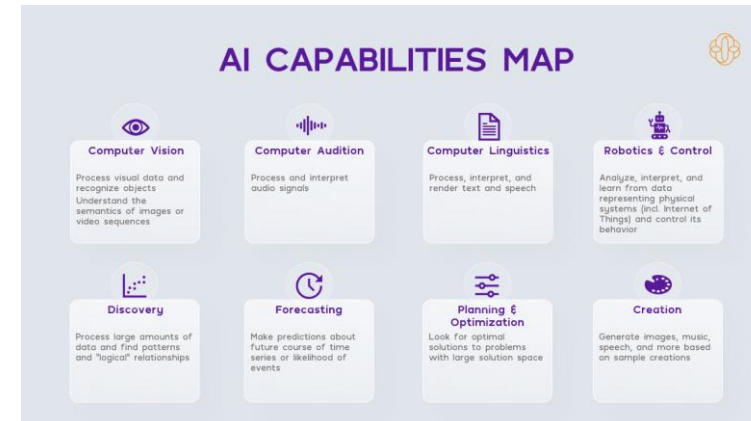

Systematically **break down your processes** into tasks and decisions, then identify individual elements that can be automated using AI.

Remember, you want to consider automating tasks, not jobs.

AI can automate decision support and actions with complex dependencies on dynamic data.

AI CAPABILITIES MAP

- Computer vision
- Computer audition
- Computer Linguistics
- Robotics & Control
- Discovery
- Forecasting
- Planning & Optimization
- Generation

DATA MAP

- Data sources
- Data forms
- Data generation
- Transfer learning
- Data assessment
- Unique data assets
- Data applications
- Data access

CONSIDERATIONS

AI PROJECT CONSIDERATIONS

AI-SPECIFIC CHALLENGES

AI Performance Uncertainty

- For novel AI use cases or untested data repertoires

AI Paradox

- It is deceptively easy to build successful AI prototypes, but fiendishly hard to scale AI.

AI Value Estimate Questions

- What scale (of possibly interacting AI applications) is required?
- What degree of maintenance is needed to adapt to new data requirements?

MAKE OR BUY

AI is NOT Plug-and-Play

- In AI, make-or-buy is more of a continuum than a binary decision.

AI Open-Source Models

- Most raw AI algorithms are (still) open source, available for free, but without immediate business value.

AI Customization

- The best vendors offer pre-trained models with graphical user interfaces to support the further process of customization.

AI-USE FLAGS

Regulatory or Ethic Flag

- Mostly when sensitive people-related data/decisions are involved

Cyber-Security Flag

- Truly critical when processes are fully automated and might get infiltrated

Resilience Flag

- It may be important to expose AI use cases to an extensive test of resilience against future extreme events not represented in the test sets.

AI STRATEGY AS CONDITIO SINE QUA NON FOR AI SUCCESS

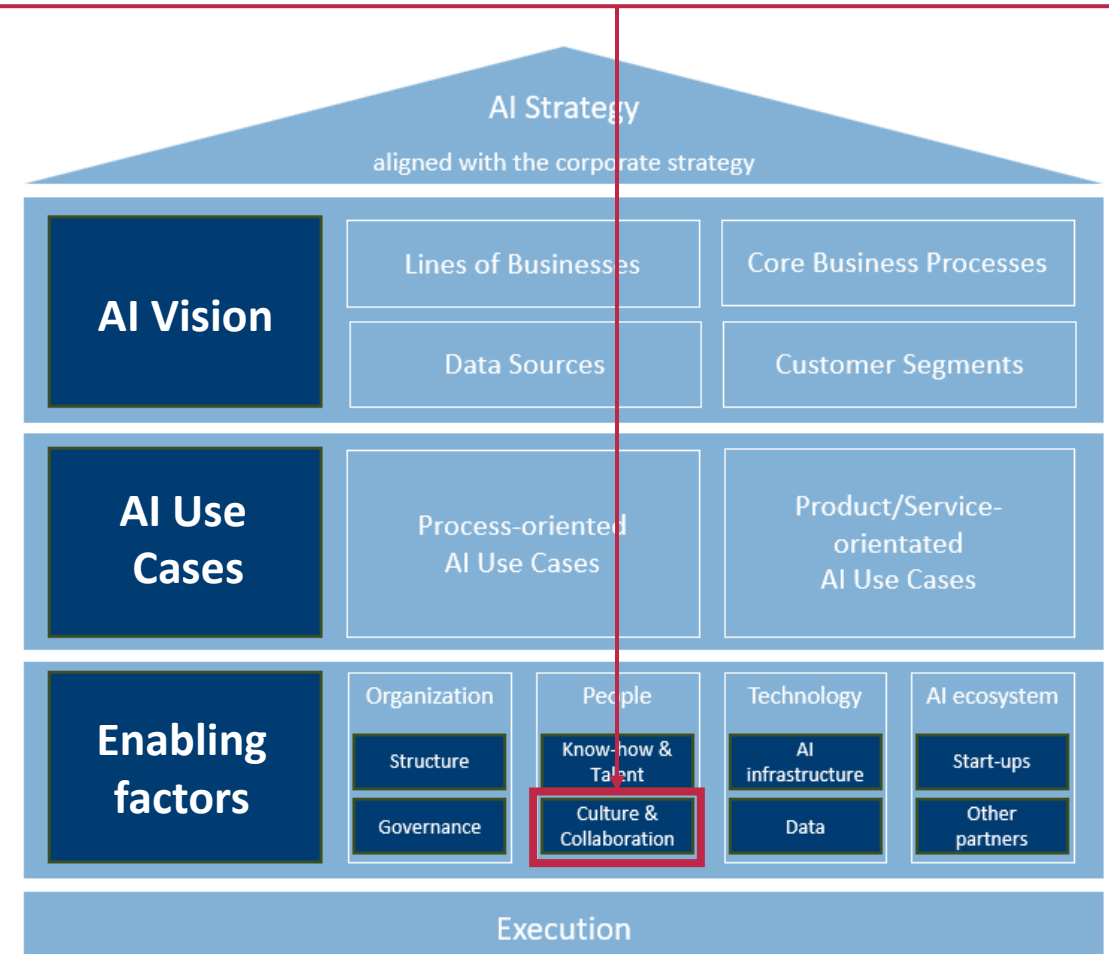

AI PROJECT FAILURE

According to Gartner, approximately 85% of AI projects fail to deliver on their promises, with many either being abandoned or failing to meet their intended objectives.

Most significant barriers for AI project success are:

- Lack of an AI vision and adoption strategy
- Lack of leadership commitment
- Lack of AI talent, AI skills and knowledge
- Inadequate change management
- Data management issues

CAVE: CULTURE EATS (AI) STRATEGY FOR BREAKFAST

AI SUCCESS PRINCIPLES

THINK BIG – START SMALL

AI is NOT IT

- Treat AI solutions as product, not project.

Governance

- Set the right balance between **central coordination and decentralized ownership** from the start.

Leadership Commitment & AI Fluency

- Demonstrate powerful leadership and broad **commitment from an AI-educated C-Level:**
 - AI transformation vision
 - Conceptual AI understanding
 - AI use case range

Think Big – Start Small

Start with a quick win AI pilot (low hanging fruit).

“MACHINE LEARNING TECHNOLOGY WITHOUT MANAGEMENT AND ORGANIZATIONAL CHANGE WILL BE INEFFECTIVE.”

“A century ago, factories electrified without rethinking their production lines and therefore saw no productivity benefits. In much the same way, machine learning technology without management and organizational change will be ineffective.”

- Erik Brynjolfsson
Director
MIT Center for Digital Business

2025 ESMO AI & DIGITAL ONCOLOGY
Annual Congress
SAVE THE DATE!
BERLIN GERMANY
12-14 NOVEMBER 2025

“(…) **Education and training** are crucial to **increase trust in AI in medicine**. (…) As a community, we **need to demystify AI** and provide **loads of opportunities for oncologists** to familiarise themselves with the basic ideas behind it.(…)”, says Dr. Mireia Crispin Ortuzar, University Cambridge, UK, Co-Chair of 1st edition of **ESMO AI& Digital Oncology Congress, Berlin, November 2025**.

CONCLUSION & RECOMMENDATIONS

AI IMPLEMENTATION SUCCESS PRINCIPLES

AI Vision & Strategy

Develop a clear AI vision and strategy (“Why? What? Who? How?”).

AI Flags

Identify AI use case flags (e.g., GDPR, EU AI Act, ethics & regulation) at an early stage.

Leadership Commitment

Ensure leadership commitment right from the start.

Data Governance

Develop a data strategy and invest in data governance, Quality & Compliance.

AI Fluency

Educate your staff about the benefits of AI in your organization and implement AI training.

Change Management

Engage and incorporate employees early in the AI implementation process.

DeepBind [81]	A computational tool to analyze binding between the protein and DNA/RNA	https://github.com/MedChaabane/DeepBind-with-PyTorch
DeepBar [82]	A method for accurate and fast prediction of binding free energy	https://fastmbar.readthedocs.io/en/latest/
Deep-Screening [83]	Web-server based in deep learning for virtual screening of compounds	http://deepscreening.xielab.net/
DeepScreen [84]	High performance drug target interaction	https://github.com/cansyl/DEEPScreen
DeepConv-DTI [45]	A convolutional neural network based model for predicting drug-target interactions	https://github.com/GIST-CSBL/DeepConv-DTI
DeepPurpose [24]	A Deep learning library for drug-target interaction, drug-drug interaction, protein-protein interaction and protein function prediction	https://github.com/kexinhuang12345/DeepPurpose
DeepTox [85]	A deep learning model for toxicity prediction of chemical compounds	http://www.bioinf.jku.at/research/DeepTox/
AtomNet [86]	A deep convolutional neural network for bioactivity prediction	github
PathDSP [87]	A deep learning method for predicting drug sensitivity using cancer cell lines	https://github.com/TangYiChing/PathDSP
Graph level representation [88]	Learning graph representation for drug discovery	https://github.com/ZJULearning/graph_level_drug_discovery
Chemical VAE [89]	An auto-encoder based framework to generate new molecules	https://github.com/aspuru-guzik-group/chemical_vae/
DeepGraphMol [87]	A computational method for molecule generation with desired properties using graph neural networks and reinforcement learning	https://github.com/dbkgroup/prop_gen
TorchDrug [26]	A pytorch based flexible framework for drug discovery models	https://torchdrug.ai/

AI TRANSFORMATION

AI TRANSFORMATION PLAN

Step 1 – Begin with the End in Mind

- Strategic anchors (3-5-year goals, key differentiators)
- AI Transformation Vision

Step 2 – The AI Opportunity Discovery Process

- Approach 1: Beginning with Workflows
- Approach 2: Beginning with Data

Step 3 – Assess Your Current State of AI Maturity

Step 4 – Drafting a Phasic AI Roadmap (top-down)

- AI Vision: Use AI Vision map for brainstorming
- Phase 3: long-term core AI-enabled capabilities
- Phase 2: possible use-cases in the next 1-2 years
- Phase 1: near-term pilot project(s)

THE AI PHASIC ROADMAP MODEL FOR AI TRANSFORMATION
